

A Regulatory Perspective on Physicochemical, Structural, and Performance Characterization of Topical Semisolid Products 17th Perspectives in Percutaneous Penetration Conference

Sam Raney, PhD

Associate Director for Science Office of Research and Standards Office of Generic Drugs | CDER | U.S. FDA April 19, 2021

Disclaimer

- This presentation reflects the views of the author and should not be construed to represent FDA's views or policies.
- The information discussed has not necessarily been evaluated by the relevant FDA centers or offices that regulate cosmetics or sunscreen products, and concepts discussed should not be misconstrued as representing policies currently under consideration by FDA centers or offices that regulate cosmetics or sunscreen products.

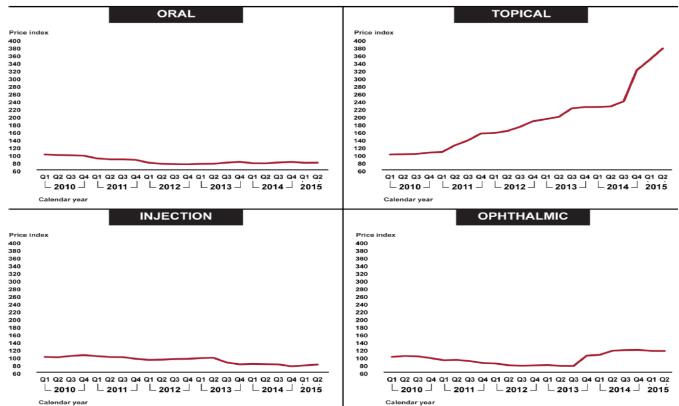

The GAO Report (GAO-16-706)

- The U.S. Government Accountability Office (GAO) Report in Aug 2016 analyzed a period spanning Quarter 1 of 2010 through Quarter 2 of 2015
- **57%** of the topical drug products experienced an extraordinary price increase in that period
- The average price of topical generic drugs was **276% higher** by the end of the period analyzed
- Manufacturers and other stakeholders reported that market competition, influenced by various factors, drives generic drug prices

Patient Access to Topical Products

- The majority of topical dermatological drug products have fewer than three generic competitors; for many products no generics are available at all.
- This may have been attributable to the historical barriers to the development of topical dermatological drug products, possibly including
 - Difficulty/issues with comparative clinical endpoint bioequivalence (BE) studies
 - The complex nature of topical formulations

Formulations Can Alter Bioavailability

- It is widely understood that the formulation of a topical semisolid dosage form can influence its performance
- It is now increasingly clear how excipients may exert their influence, by modulating the physicochemical and microstructural arrangement of matter in the dosage form
- The resulting physical and structural characteristics of topical dosage forms, and their metamorphic properties on the skin, can directly influence topical bioavailability

Topical Dermatological Formulations

- Components, composition, physicochemical, and structural properties of a topical product can influence:
 - The drug state(s) and phase(s) of the dosage form
 - The distribution of the drug in the dosage form
 - Drug diffusion within the dosage form
 - Drug partitioning from the dosage form into the skin barrier
 - The structure and chemistry of the skin barrier
 - Drug diffusion within the skin itself
 - Drug delivery and bioavailability at the target site
 - Skin (de)hydration, irritation, or damage
 - The metamorphosis of the dosage form on the skin

The Concepts of Q1, Q2, Q3

- Q1: Components in a product
 - Q1 characterization of a reference product provides a profile of the qualitative components (ingredients) in that reference product
- Q2: Composition of a product
 - Q2 characterization of a reference product provides a profile of the quantitative formulation composition of that reference product
- Q3: Arrangement of matter in a product
 - Q3 characterization of a reference product provides a profile of physicochemical and structural attributes that is quintessentially characteristic of that reference product

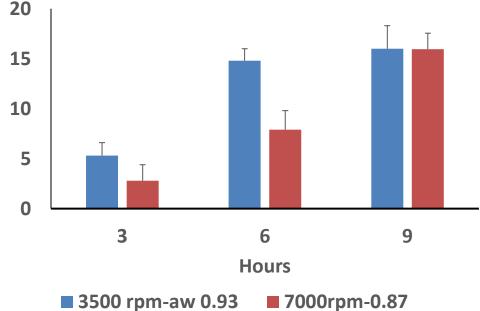

Q3 Characterization

- 1. Appearance and texture
- 2. Number and type of phase states
- 3. Structural organization of matter
- 4. Polymorphic form(s) of the active ingredient
- 5. Rheological behavior under a range of conditions
- 6. Water activity and/or drying rate
- 7. pH and buffering capacity
- 8. Profile of oleaginous components
- 9. Specific gravity
- 10. Metamorphosis-related changes

Dosage Form Metamorphosis

• Solvent Activity of Q1/Q2 Identical Creams

Topical Dermatological Formulations

- Clinical evidence has demonstrated the bioequivalence (BE) of several topical generics that are not necessarily Q1, Q2, or Q3 the same as the reference product
- An expanding body of evidence has demonstrated that these topical generics exhibit comparable cutaneous pharmacokinetics (PK) ...not only comparable clinical efficacy

When do Q1, Q2, or Q3 differences impact the BE of topical products, and <u>what may be acceptable differences between a</u> <u>test and reference product formulation</u>?
