A Multiscale Computational Framework for Inhalation Pharmacology and Drug Development

Narender Singh, Ravi Kannan and Andrzej Przekwas

Computational Medicine and Biology (CMB) Div.
CFD Research Corp., Huntsville AL 35806

Collaborative Project with FDA CDER, Office of Generic Drugs
FDA Project Officer Dr. Renish Delvadia
Grant no.: 5U01FD005214-02

Public Workshop:
New Insights for Product Development and Bioequivalence Assessments of Generic Orally Inhaled and Nasal Drug Product

FDA, January 09, 2018

Outline

- **CoBi** – Computational Physiology and Pharmacology
- **Multiscale** Computational Respiratory Pharmacology Tools
- Automated Generation of **Lung Model** (population)
- **Q3D** Simulations of Respiration and Aerosol Inhalation
- Airway **Barrier** Model
- **PBPK** Model and Validation Results for ICs
- Effects of Product **Formulation**
- Role of In Vitro **Dissolution** & Transport Models for **IVIVE**
- **Bioequivalence**
- Conclusions and **Recommendations**

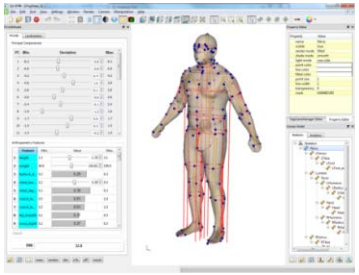
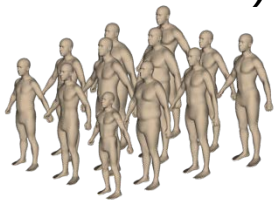
Human Lung Models (Geometry, 3D/Q3D Mesh)

Anthropometric data as inputs for body generation

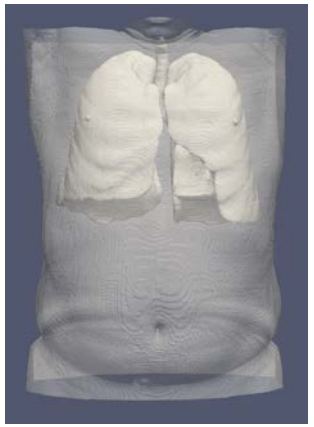


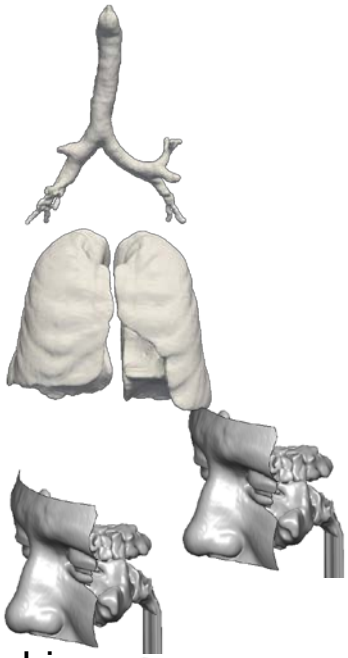
Population (personalized)



Extraction of body/thoracic parameters

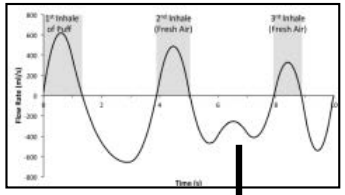
Thoracic/lung imaging data to calibrate lung PCA





Proportional scaling of oral-pharynx (match trachea)

Spirometry inputs to calibrate lung respiration function (flow) (BCs)

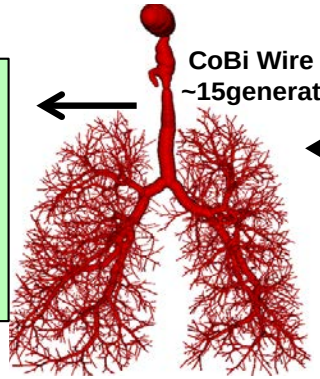


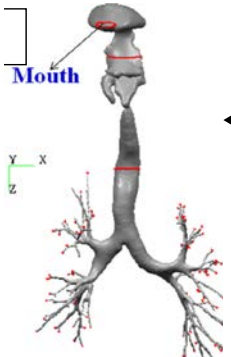
Propagate the airway bronchial tree to fit the lung lobes

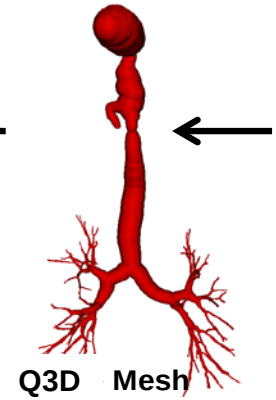
Morph CFDRC Zygote HF airway to match Q3D

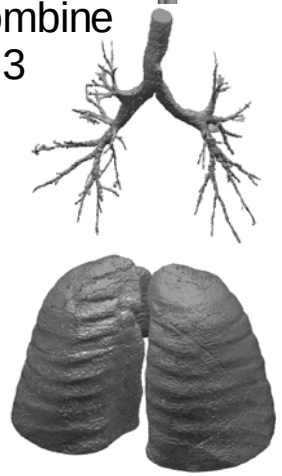
Generate airway Q3D model

Combine all 3







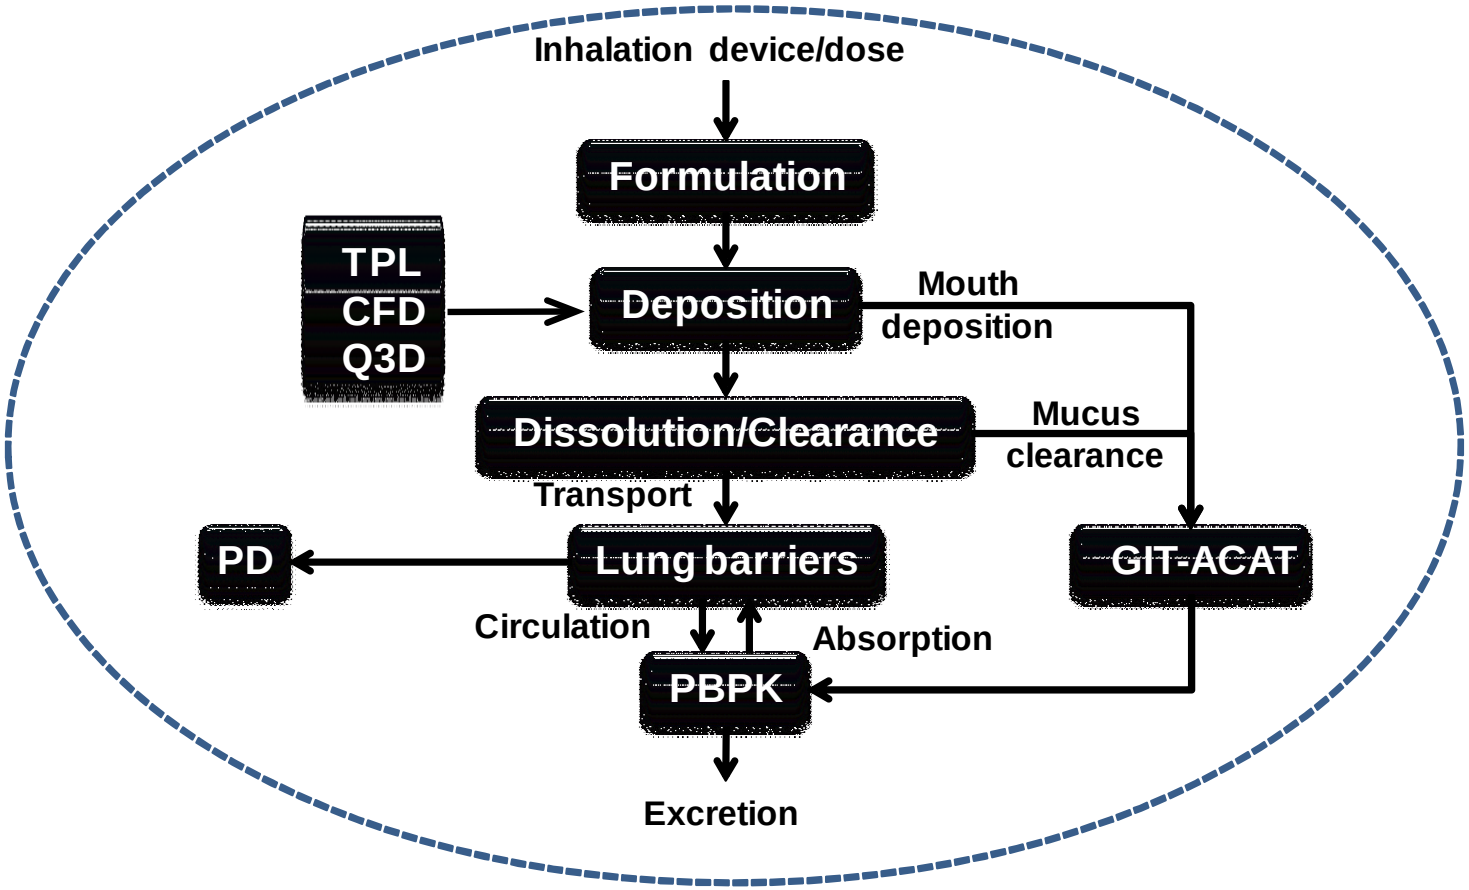


Generate Airway Mesh
- 3D+Q3D for HF sim
- Q3D for fast sim.
- Aerosol inhalation &Deposition

CFDRC-FDA Goals and Framework

- Develop, evaluate, and improve **physiologically-based absorption and pharmacokinetic models of pulmonary (inhaled) drugs**.
- Support the development and **evaluation of generic drugs**, products, and application review in this field.

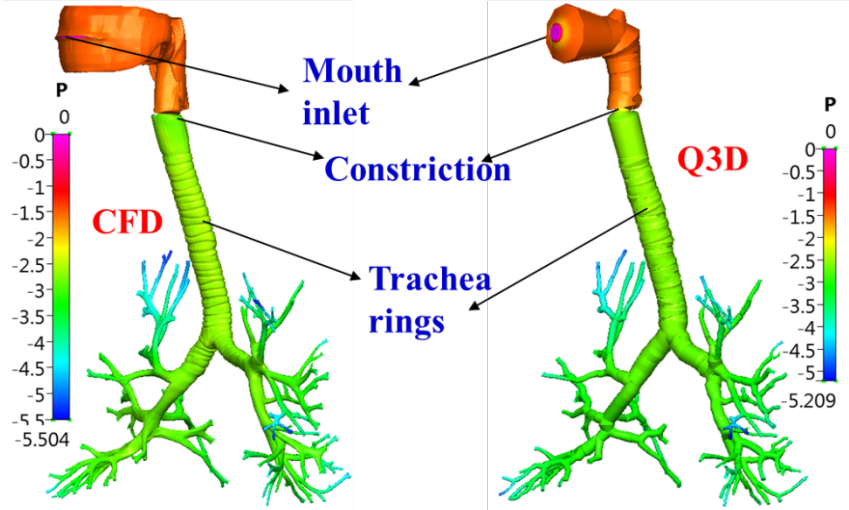
Integrated computational framework for pulmonary drug delivery and PBPK-PD simulation.



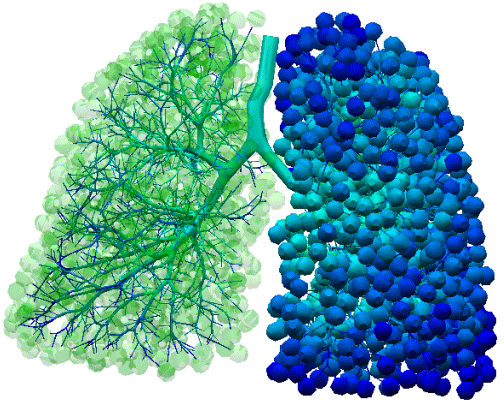
Drug Deposition: Airway lumen and wall models

- Empirical Typical Path Lung (**TPL**) model: Fast and can predict the drug property based particle depositions in the NOPL/TB/P regions for lung
- 3D **CFD** model/mesh: ~5-6 generations (200+ outlets!) : O(1.5M) cells
- Quasi-3D (**Q3D**) wire mesh: O(1500) cells
  - Robust, fast running and easily adaptable Quasi-3D wire mesh
  - Comprises of a structure of connected wires, with well-defined radii
  - Error margin: 5%(laminar)-10 %(turbulent); 10K fold speedup w.r.t. CFD
- **Applications**: Spirometry simulations & calibrations, Nitric Oxide calibrations, Distributed PKPD simulations

3D vs Q3D validation. Flow rate: 5L/min



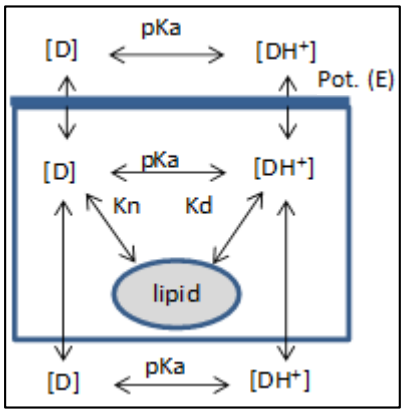
O2 exchange animation, using Q3D model.

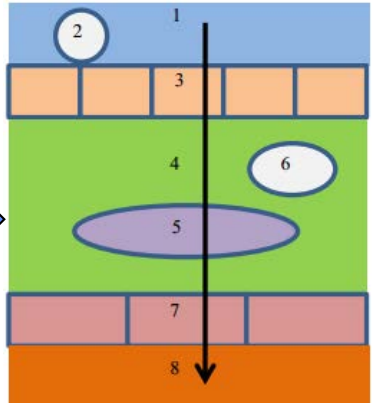


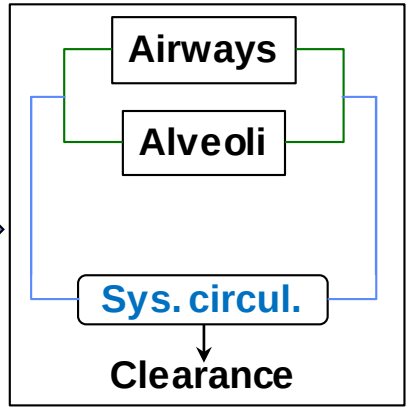
CFDRC: Kannan et al. A Quasi-3D wire approach to model pulmonary airflow in human airways. 2016 IJNMBE, DOI:10.1002/cnm.2838

Drug Deposition: Lung barrier transport model

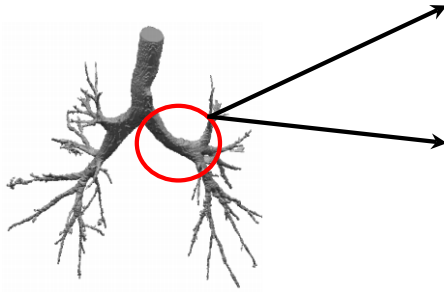
- **Rosania** model: Predict drug retention/transport across lung tissue
- Model considers drug **ionization**, **partition** into lipid components, and passive **diffusion** across the air-plasma barrier
- Processes are determined by **drug physicochemical properties** (e.g. logP, pKa) & tissue anatomy and physiological/pathological properties (**barrier thickness**)

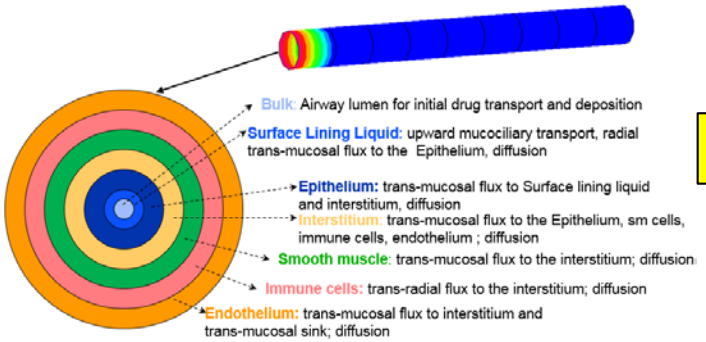






1. Mucous
2. Macrophages
3. Epi cells
4. Interstitium
5. SM cells
6. Immune cells
7. Endo cells
8. Blood



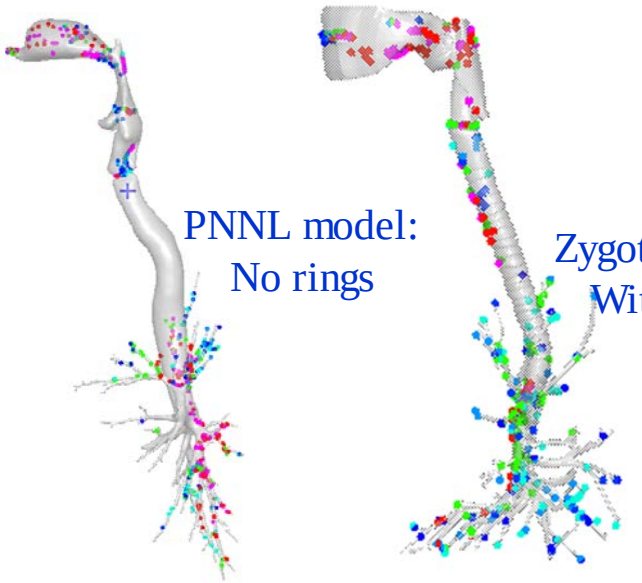


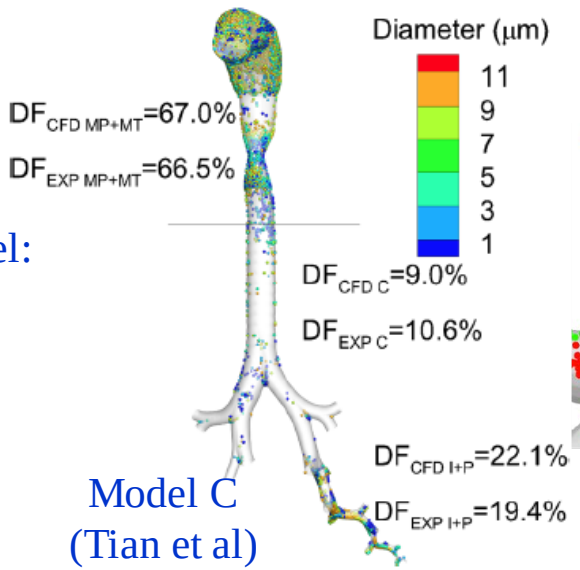
Q3D airway barrier model

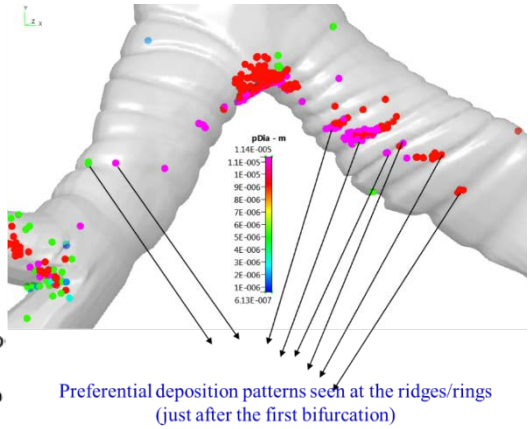
Yu & Rosania et al.
Pharm Res. 2010;27(3):457-67

Drug Deposition: Model comparisons

- CFD Model Geometry & mesh generation:
  - Represent **multiple generations**
  - Euler Lagrangian (**EL**) vs Euler Euler (**EE**) models
  - EL used mainly for **drug** depositions. EE for **aerosol** deposition.





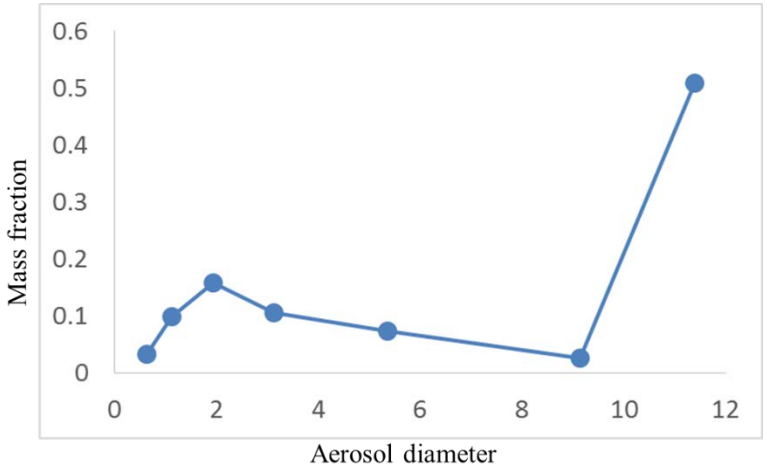


- Q3D model can get the depositions in different lung airways regions. Accurate for aerosol depositions. Full EE model
- **Currently developing EE** (CFD and Q3D) models for modeling prolonged inhalation of aerosols (minutes)

CFDRC: Kannan et al. Pharmaceutical aerosols deposition patterns from a Dry Powder Inhaler: Euler Lagrangian prediction and validation. 2016 MEP.

Deposition Validation: Budesonide Novolizer DPI

- Modeling **Budesonide** drug deposition on the human airways
  - Transient flow rate provided by the **Novolizer DPI**
  - Drug particle mass distribution (**polydisperse**) provided by the Novolizer DPI
  - **Good match** with previous published results (Tian et al) of % deposition



Mass fractions of the aerosol particle size distributions for the Novolizer (model inlet BCs).

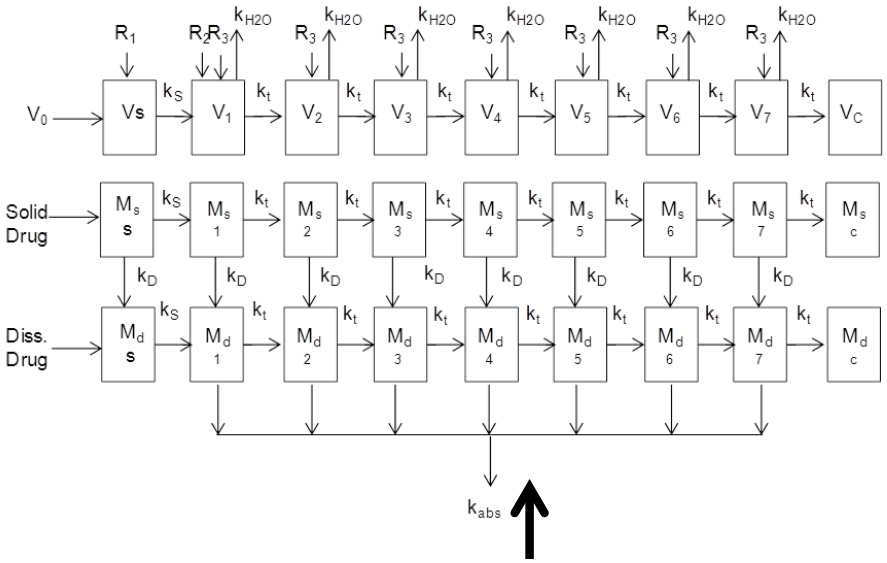
Location	Tian et al	CFDRC	Cast
NOPL	67	56.54	66.5
Trachea-B3	2.7	4.68	
B4-B7	8.2	7.37	
NOPL to Gen7/8	77.9	68.45	

Novolizer deposition comparisons

CFDRC: Kannan et al. Pharmaceutical aerosols deposition patterns from a Dry Powder Inhaler: Euler Lagrangian prediction and validation. 2016 MEP.

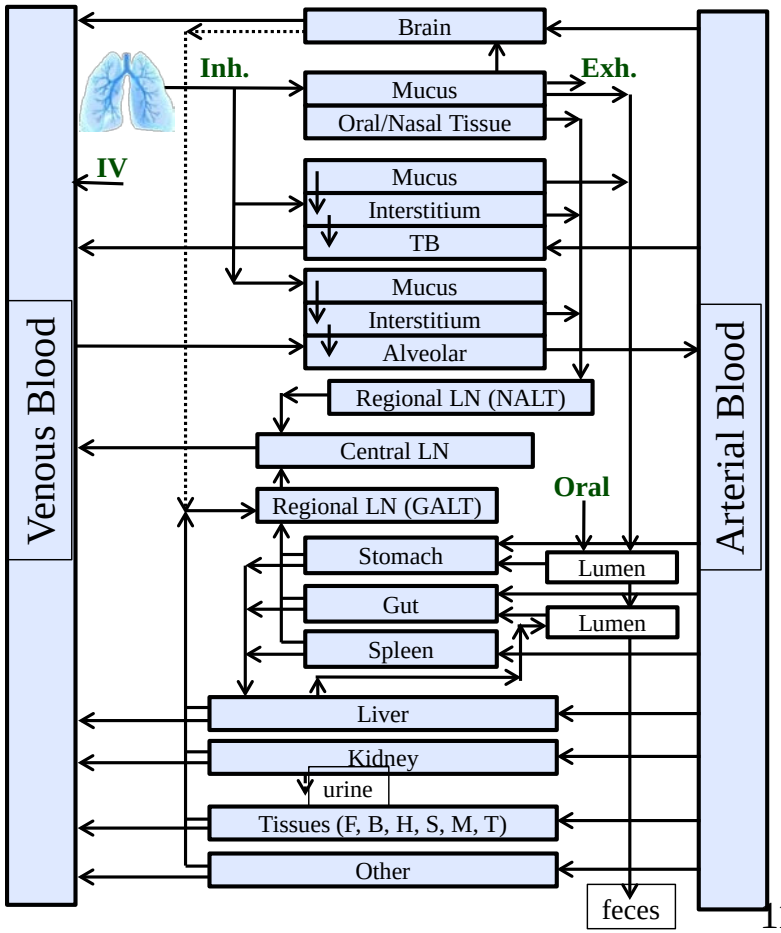
Whole-body PBPK & Link to Deposition/Systemic

- Whole-body human PBPK: Central component of **drug ADME**
  Connect lung barrier model (through blood compartment) and gut models
  PBPK: 19 compartments that can test multiple delivery route
- **Gut model** (CAT): Imp since the swallowed drug contributes to drug PK
  9 segments connecting 'stomach(1)-intestine(7)-colon(1)'



Gut (ACAT) model

Whole-body PBPK →

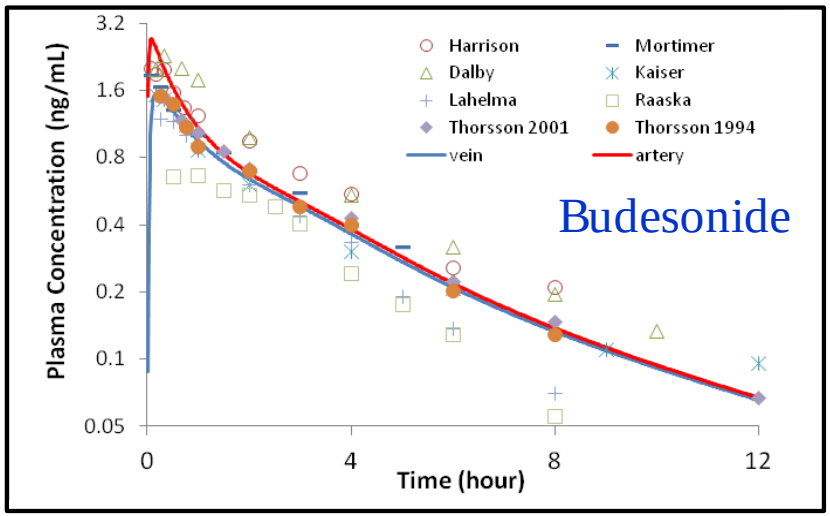


Full Framework Compartmental PK Validation

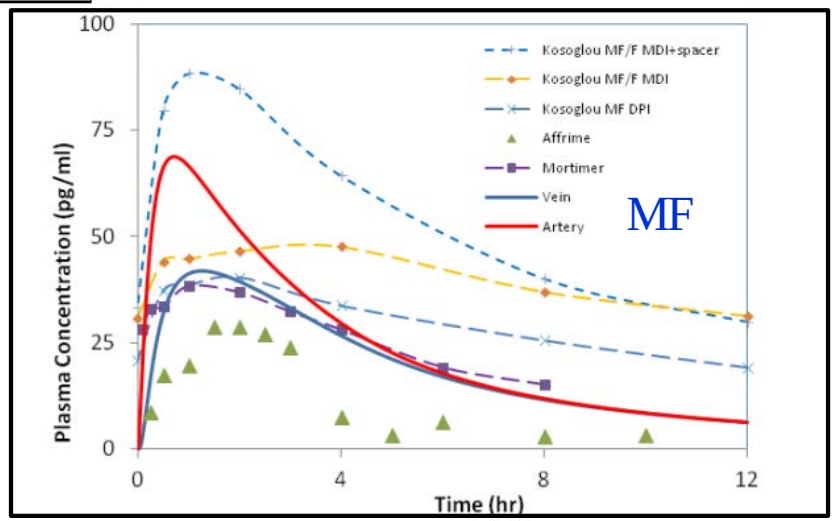
Parameters values for inhaled **Mometasone Furoate (MF)** & **Budesonide**

Parameters	MF	Budesonide
Particle density (g/cm^3)	1.23	-
MMAD of particles (µm)	2.2	-
Molecular weight	427.4	430.5
Intestinal permeability(cm/hour)	0.11	-
Solubility (µg/mL)	5.23	**45**
B2P	0.55	0.90
Protein Binding	98-99%	85-90%
fu	1.5%	12.5%
Liver extraction rate	99%	80%
Half-life time after IV (hour)	4.5	2.0-3.6
First Pass Effect	99%	10-20%
Clearance rate after IV (ml/min)	892	

- Types of drugs : ICs, Beta-2 agonists (short/long acting), Anticholinergics



Budesonide plasma conc. after 1000 µg **inhalation** dose. Plotted are the various experimental data normalized (for some) to dose of 1000 µg.



MF plasma conc. after 400 µg **inhalation** dose.
Plotted (solid circles) are the experimental data from literature

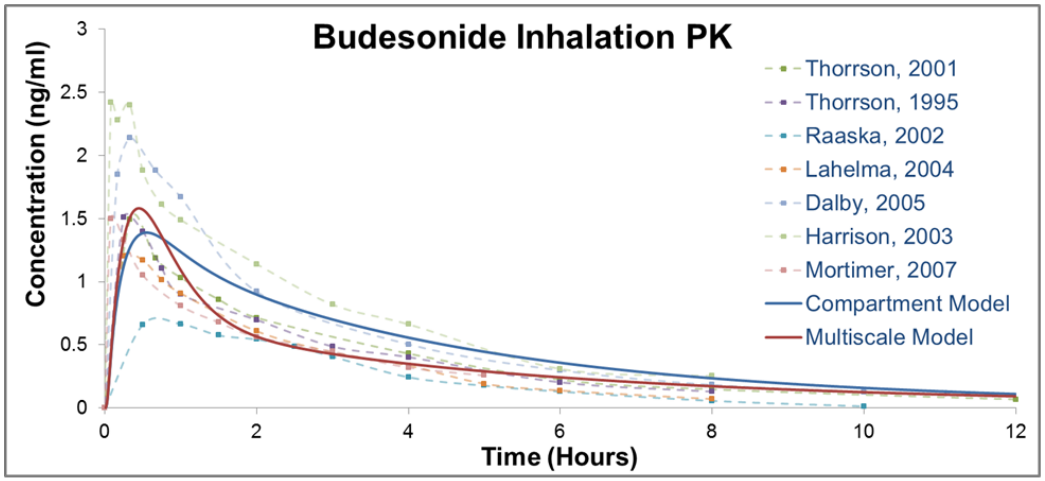
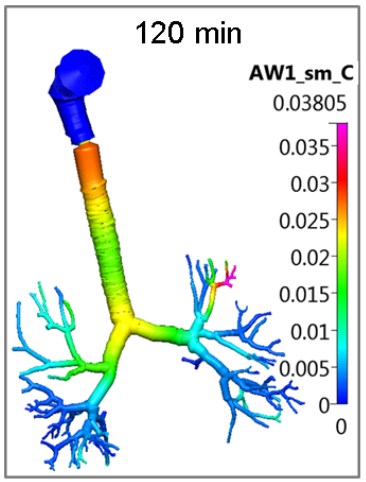
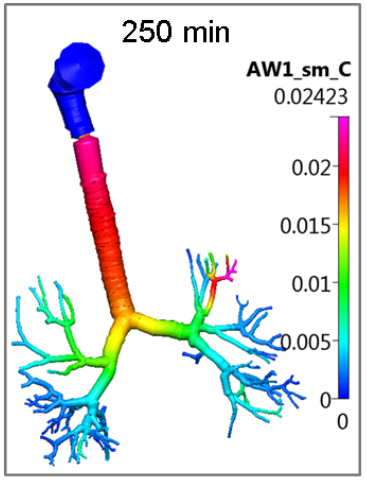
Integrated Multiscale Lung-PBPK Model (Budesonide)

- Budesonide: 1mg Budesonide inhalation (DPI): healthy cases
- Deposition values: From CFDRCs novalizer results and Tian et al
- Good match with experiments. AUC and Cmax are within experimental range
- Shape/Slope and AUC obtained from the multiscale model are better than the compartmental model

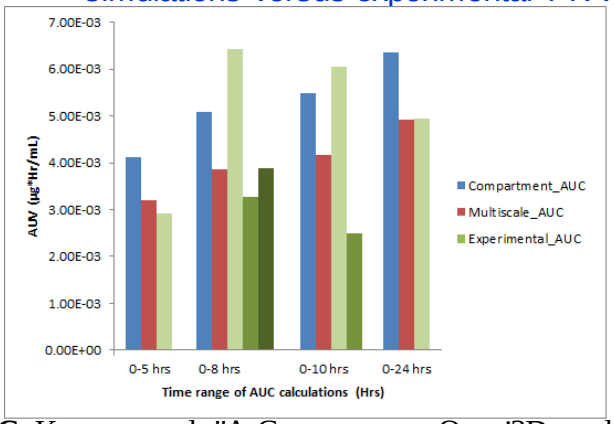


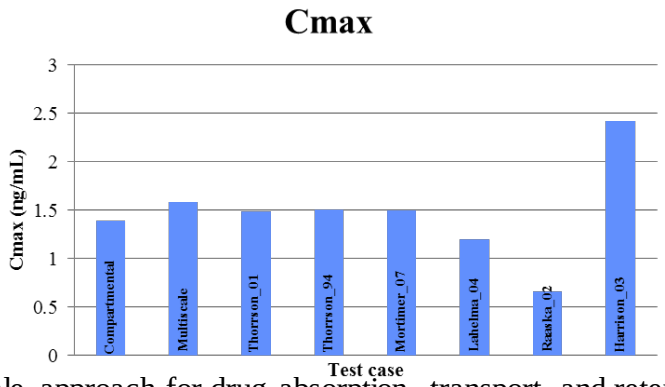
Inhalatory drug PK (healthy): Compartmental & multiscale simulations versus experimental PK values





Concentrations in airway smooth muscle (**AW_sm**) cells



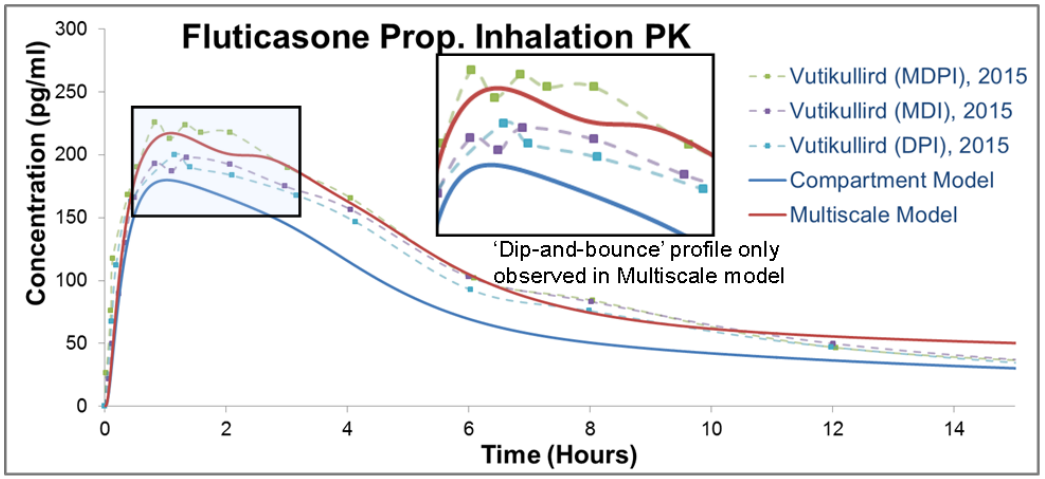


AUC and C_{max} comparison of compartmental and Q3D simulations vs experiments

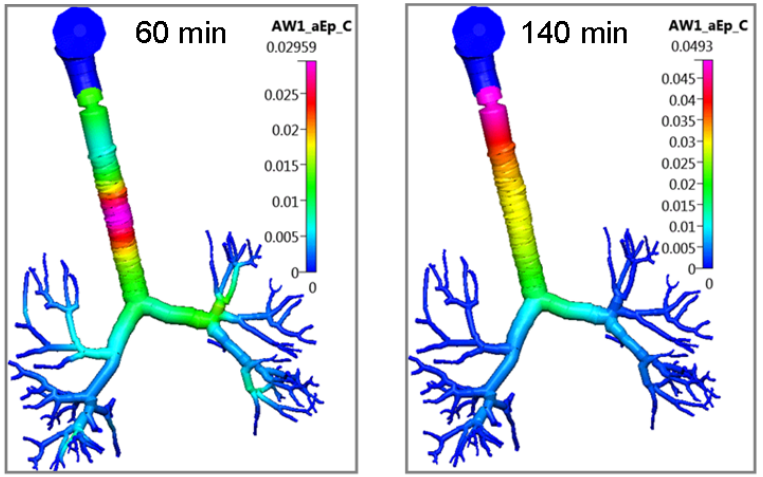
CFDRC: Kannan et al. "A Compartment-Quasi3D multiscale approach for drug absorption, transport, and retention in the human lungs. IJNMBE (DOI: 10.1002/cnm.2955)

Integrated Multiscale Lung-PBPK Model (FP)

- Fluticasone propionate: 1mg FP inhalation (DPI): healthy case
- NOPL region has around 72-78% (Exp). We scaled the OPL region to 75%
- Very low systemic bio-availability and solubility (1/100th that of Budesonide), i.e. dissolution time in mucosa is >8 hrs for FP compared to 6 mins of Budesonide



Inhalatory drug PK (healthy): Compartmental & multiscale simulations versus experimental PK values



Concentrations in airway apical-epithelial (**AW_aEp**) cells; Note the appearance of blobs, unlike the Budesonide case (due to poor solubility)

- Conc. in the vein is much lower than the Budesonide simulations due to low solubility
- In both cases (compartmental vs multiscale), the initial rise is the same, since it is dictated by the GUT model (since the drug transport to the GUT is very fast and the low dissolution and transport across the lung walls is a slow process)
- DIP-AND-BOUNCE phenomenon is observed only in the multiscale model (similar to experiments).

CFDRC: Kannan et al. "A Compartment-Quasi3D multiscale approach for drug absorption, transport, and retention in the human lungs. IJNMBE (DOI: 10.1002/cnm.2955)

Pharmacodynamics Modeling (PD)

- PD is done in-sync with the current 7 layer Rosania's PK model for **each airway section G0-G15** (*Gaz et al*. J Pharmacokinet Pharmacodyn 2012, 39:415–28)
- The adapted model **computes the diameter as a function of time** based on the mass of the drug at time t & the location z and the potency of the drug to keep the diameters relaxed
- PD was done on **both compartmental and Q3D frameworks** (both formats needs more rigorous validation and parameter fitting etc. based on experimental data – not available)

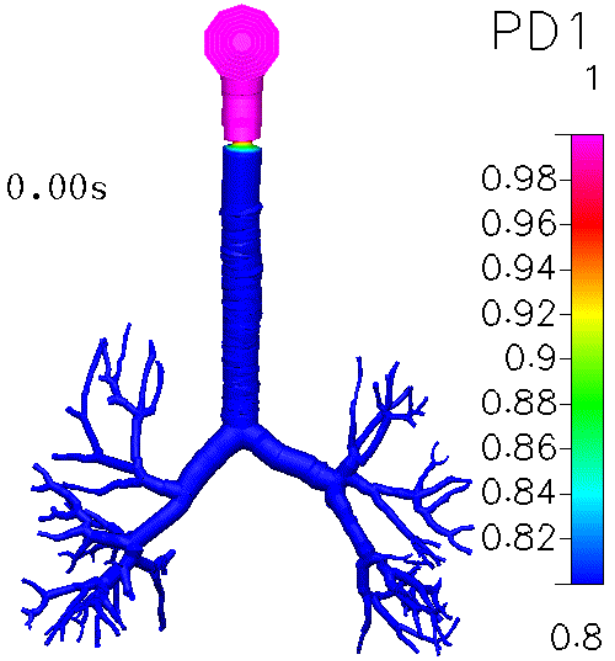
$$\frac{\partial D_i}{\partial t} = K_{DRUG} \frac{C_i}{C_{MAX}} N_{RECEPTORS} A_i - K_{DISEASE} B_i$$

$$A_i = D_i < DH_i \; ? \; DH_i - D_i \; : 0$$

$$B_i = D_i > DD0_i \; ? \; D_i - DD0_i \; : 0$$

i = The generation number
$\mathbf{K_{DRUG}}$ = Rate coeff. describing the drug potency
$\mathbf{C_i}$ = Conc. of the dissolved drug in that region
$\mathbf{C_{MAX}}$ = Scaling coeff.
$\mathbf{N_{RECEPTORS}}$ = # of ASM receptors/unit-volume.
$\boldsymbol{K_{DISEASE}}$ = Rate coeff. that forces the diameters to return to their pre-drug levels
$\boldsymbol{DH_i}$ = Diameter of the healthy specimen at Gen #i
$\boldsymbol{DD0_i}$ = Diseased diameter prior to drug inhalation

- **Test case**: 1000 µg Budesonide inhalation, assuming a uniform 20% diameter shrinkage (non-uniform can also be handled); (180000 ~ 2 days)
- Lower airways have the least amount of the dissolved drug
- Consequently, difficult to maintain the "relaxed" diameter levels at these locations.



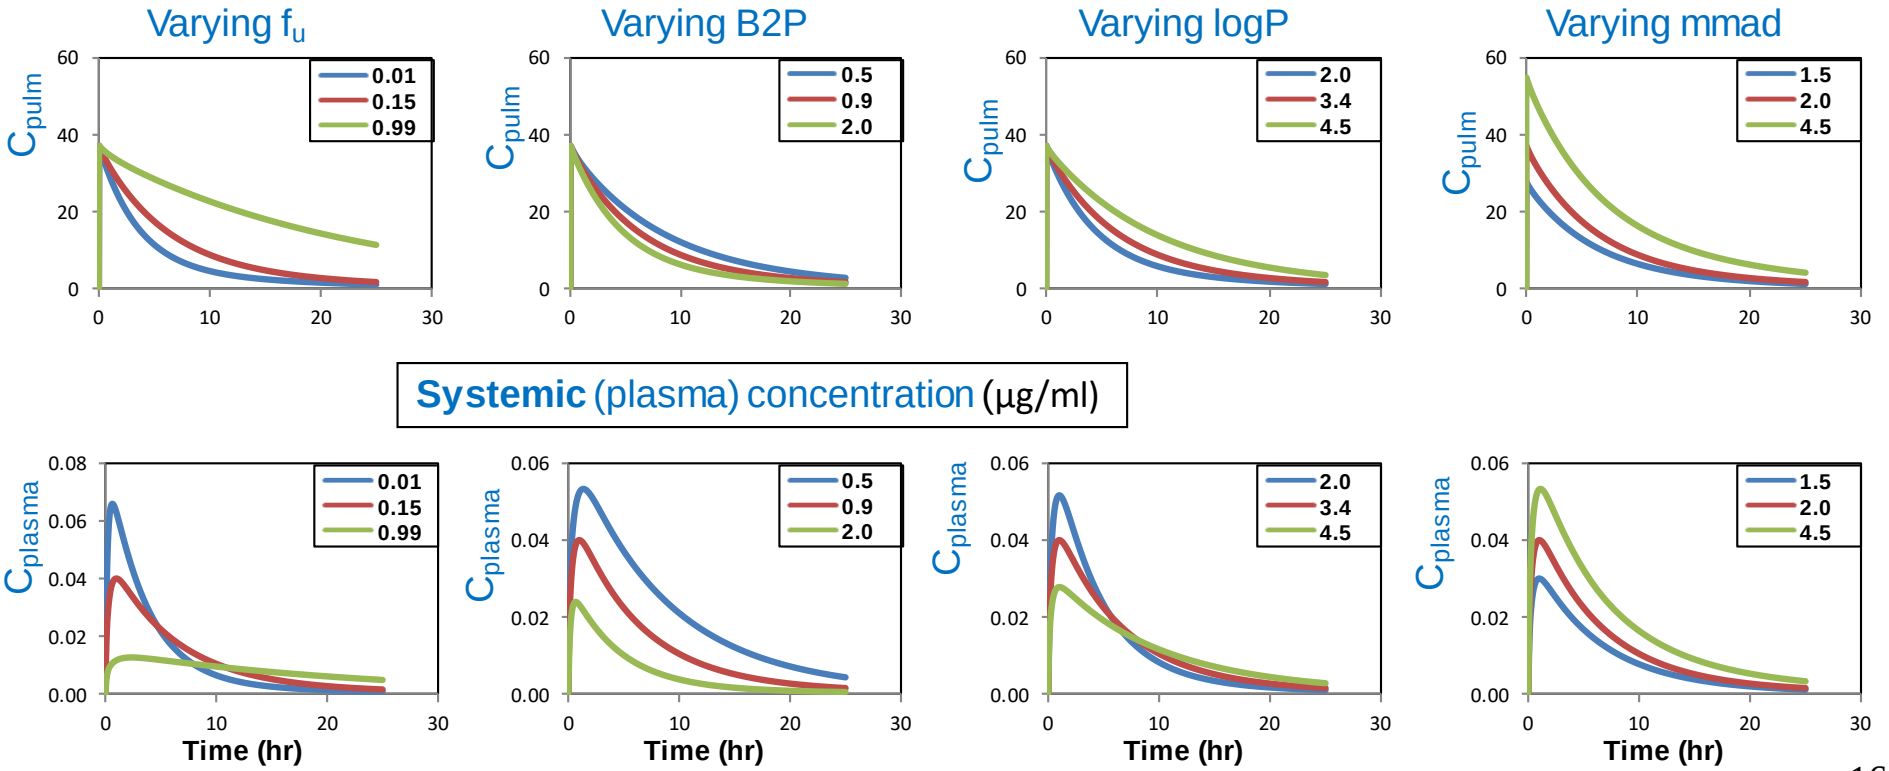
Local non-dimensional lung diameters

Formulation Effects on PK

- **Two types** of formulation effects on PK: Physiochemical and FPF%
- Physiochemical property related changes: logP, mmad, fu etc.
- Carrier related changes: Effect FPF%

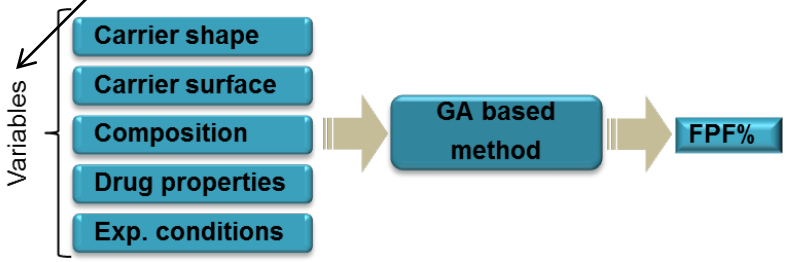
fu: fraction of unbound drug in plasma - Driving force behind the transport of the drug from lung to plasma;
B2P: (blood-to-plasma partition ratio) Drug partitioning in the blood cells (RBC);
logP (hydrophobicity): Influence the transport rate of the drug through various physical compartments after dissolution;
mmad: mass-median particle diameter that has 50% of the aerosol mass residing above and 50% of its mass below it

Pulmonary (lung) concentration (µg/ml);



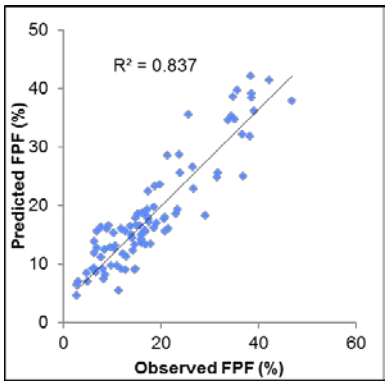
Formulation Effects on PK

- **Two types** of formulation effects on PK: Physiochemical and FPF%
- Physiochemical property related changes: logP, mmad, fu etc
- Carrier related changes: Effect FPF%
- **Most formulation effects are through FPF% in literature**
- Variation in FPF is calculated through empirical modeling of 28 various formulation factors (**variables**).



FPF (%) =

((-C7+C17+C4-C14-C16-EXP(C27))/(C25-C5))-(C18/((C32-C27*(C18)^(C33/2))*(C25-C5)))+((C17-C6*C21)^C4)/(LN(C16)*(C25-C5))



Variable group	Variable name	Variable sign	Budesonide values
Exp condition	Impactor type	C1	1
Quant composition	Mannitol content	C2	0
Quant composition	Lactose content	C3	0
Quant composition	Hydroxyapatite content	C4	1

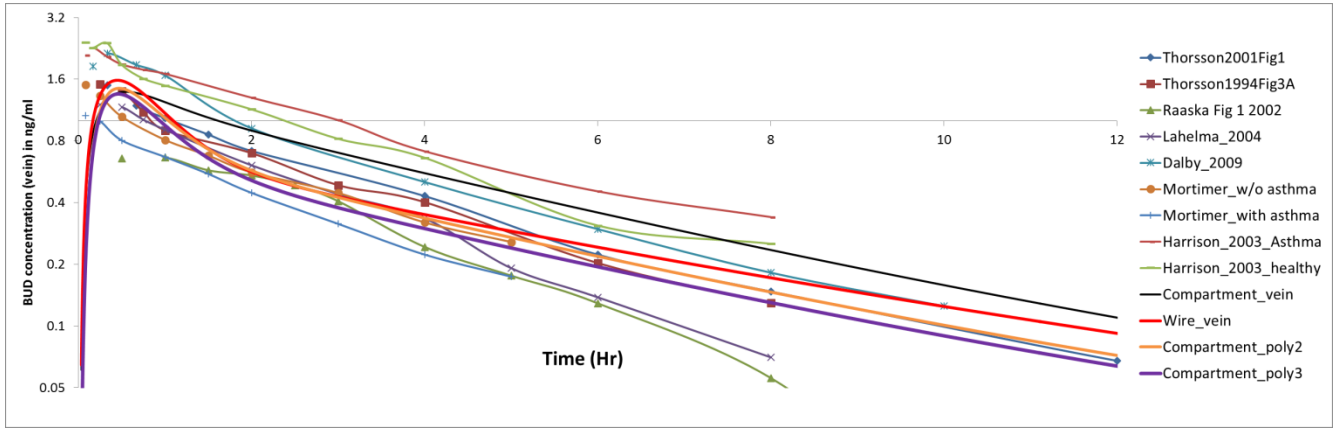
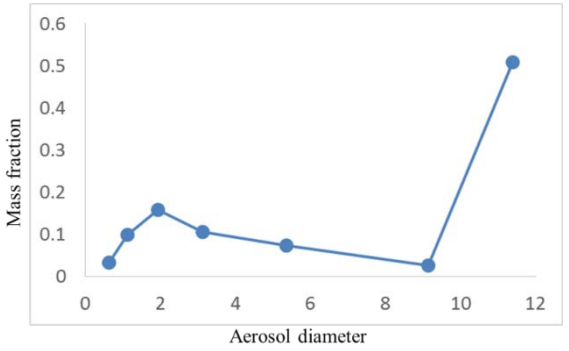
Eq constants	Constant2	C2	3.456648

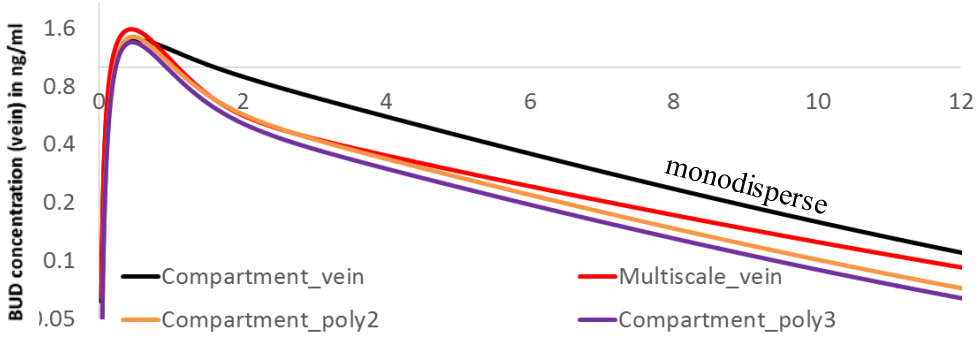
Mendyk et al. Int J Nanomedicine. 2015; 10: 801–810.

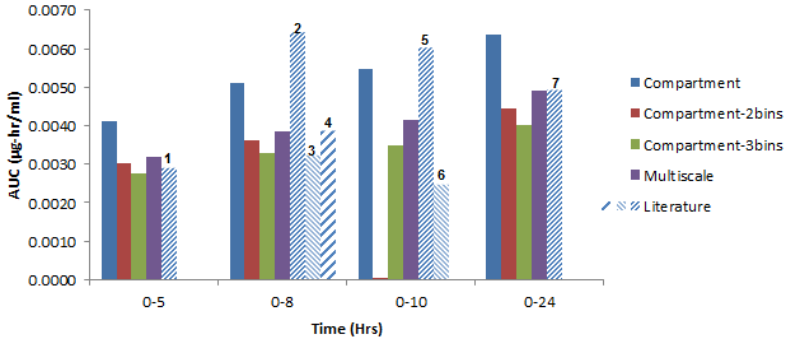
Formulation FPF effects on PK

- FPF was further used to enhance compartmental and Q3D approaches through **multiple "bins"** to induce the poly-disperse effect on **Budesonide and FP** (not shown) drugs









- A much better agreement, using the poly-dispersed compartmental model
- Just 2 bins are sufficient to get qualitatively good results.
- Can be used for performing formulation specific simulations: using the FPF Equation

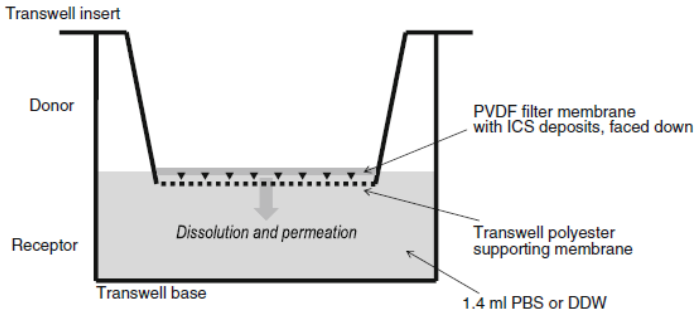
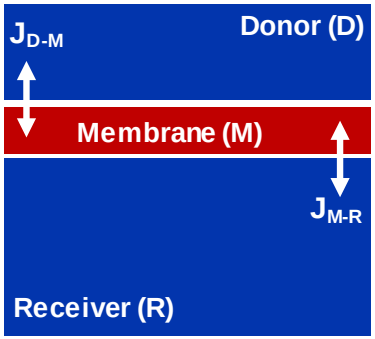
Dissolution Modeling of Drugs Using Transwell



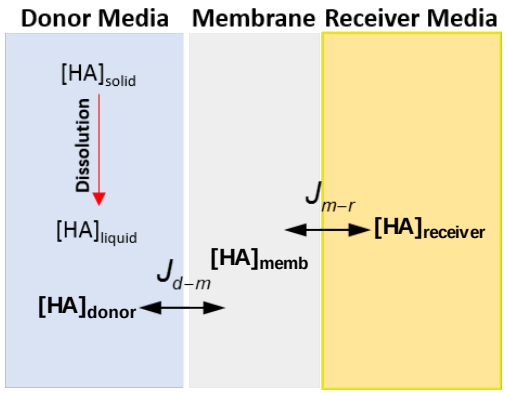
Transwell Schematic



Dissolution model: The dissolution of the solid particles is modeled using the ***Noyes-Whitney Equation*** or the ***Nernst-Brunner Equation***.

$$\frac{dm_d}{dt} = \sum_{i=1}^{n} \frac{DA_i(t)}{h_i(t)} \left(C_s - \frac{m_d}{V} \right)$$

D	– Diffusion Coefficient
$A_i(t)$	– Surface Area of a Particle
$h_i(t)$	– Thickness of Diffusion Layer
C_s	– Solubility
m_d	– Dissolved Mass



Mathematical model of a Transwell.

Donor media concentration:

$$V_d \frac{dC_d}{dt} = -J_{d-m} + \dot{m}_{dissolved}$$

Membrane Concentration:

$$V_m \frac{dC_m}{dt} = J_{d-m} - J_{m-r}$$

Receiver Media Concentration:

$$V_r \frac{dC_r}{dt} = J_{m-r}$$

Diffusive Fluxes Across the Interfaces:

$$J_{d-m} = A \frac{1}{\frac{\delta_m}{D_m} + \frac{\delta_d}{D_d}} (C_d - C_m) \qquad J_{m-r} = A \frac{1}{\frac{\delta_m}{K_p D_m} + \frac{\delta_r}{D_r}} \left(\frac{C_m}{K_p} - C_r \right)$$

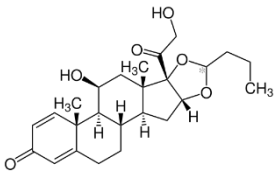
V_d	– Donor Media Volume
V_m	– Membrane Volume
V_r	– Receiver Media Volume
C_d	– Donor Media Concentration
C_m	– Membrane Concentration
C_r	– Receiver Media Concentration
J_{d-m}	– Diffusive Flux: Donor to Membrane
J_{m-r}	– Diffusive Flux: Membrane to Receiver

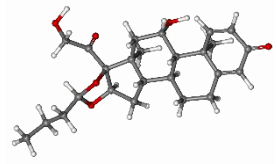
Dissolution Modeling of Inhalation Drugs

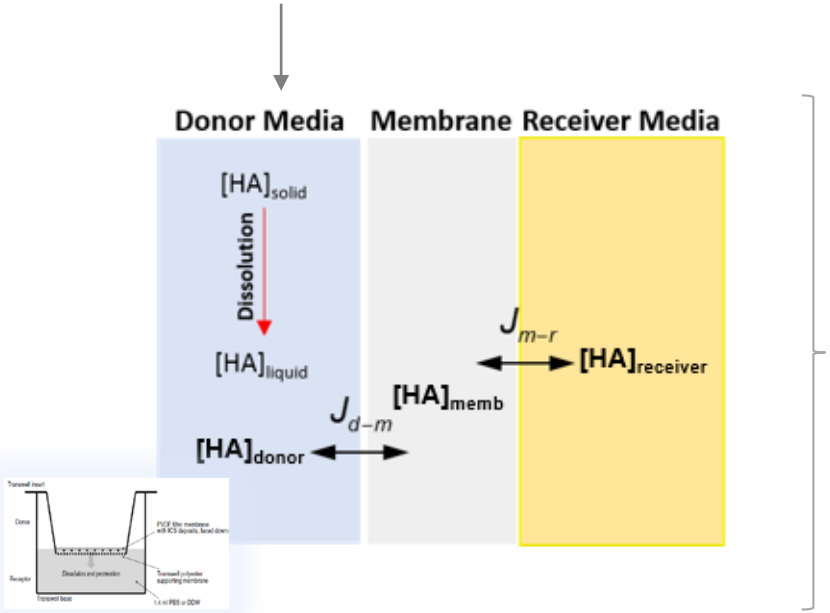
a. Dissolution behavior can be modeled using the physico-chemical properties of the drug

Properties of Budesonide	
MW	430.534
logP	2.5
Solubility	17 µg/ml

User Inputs	
Initial Mass	1.7 µg
Particle Size	2.5 µm





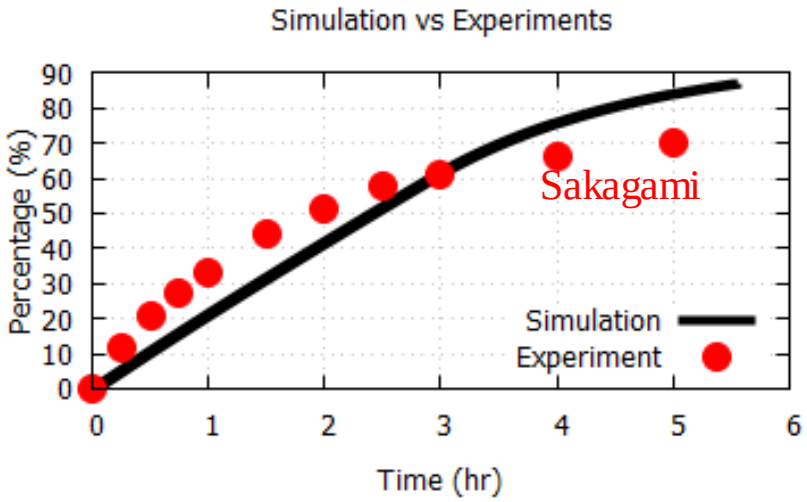


b. Mathematical models of the Transwell were developed using both ODE and PDE based formulations

$$\frac{\partial C}{\partial t} = \frac{\partial}{\partial x} D \frac{\partial C}{\partial x} + S \rightarrow$$ **Source or Sink term (efflux, metabolism etc.)**

CFDRC's CoBi Framework solves PDE transport equation simultaneously in the entire domain i.e., from the top free media surface of the donor compartment, through the membrane to the bottom of the receiver reservoir

Dissolution behavior of Budesonide



**The slight difference between the experimental result and the simulation prediction might be due to the assumption made here. These include:

1. Receiver compartment is unstirred
2. Samples taken from the bottom of the receiver compartment

Experimental data was extracted from
Arora, Deepika, Kumar A. Shah, Matthew S. Halquist, and Masahiro Sakagami. "In vitro aqueous fluid-capacity-limited dissolution testing of respirable aerosol drug particles generated from inhaler products." *Pharmaceutical research* 27, no. 5 (2010): 786-795.

Conclusions and Recommendations

- Developed and multiscale simulation framework for inhalation pharmacology - - inhalation, deposition, dissolution, absorption, transport and systemic PBPK
- Established novel aerosol inhalation and deposition simulation framework combining 3D and Q3D approaches
- Developed healthy and diseased state lung models based on experimental data
- Demonstrated formulation effects and physiochemical parameter effects on pulmonary and systemic circulation
- Validated the integrated framework on several inhaled corticosteroids/others
- CoBi Inhalation Pharmacology and GUI tools as an Open Source framework
- Future:
  - Modeling of non-ICS inhalation drugs and drug combinations of ICS and non-ICS
  - Establish a computational platform for IVIVE for inhalatory delivery of drugs
  - Study the effects of specific inhalatory drug formulations (bioequivalence): carrier effects: density, aerodynamics, agglomerate sizes, type of carrier (mannitol, lactose, sorbitol): How carrier binding effect drug dissolution
- **Establishing FDA funded tools as free access Weblets for in vitro and in vivo Inhalation Pharmacology**

Weblet – Drug Dissolution-Permeation in a Transwell

Free interactive access to web-based and cloud computing using CoBi tools and Inhalation Pharmacology models
